Chapter 16/17: Immune system

Lecture

Chapter 16: Nonspecific defenses First line of defense

Formed elements Second line of defense Complement system

Chapter 17: Specific defenses Antibodies

Humoral response Cellular response

<u>Lab</u>

Review results from Wed. (innoculate Lac/Glu broths)

Lab EXAM

Immunity terminology

Susceptibility- Lack of resistance to a disease

<u>Resistance/immunity-</u> Ability to ward off disease

Innate (nonspecific) immunity- Resistance to all microbes; present from birth (can be species specific)

Adaptive (specific) resistance- Resistance to a specific pathogen

Host defense systems

Innate (Nonspecific) Immunity		Adaptive (Acquired) Immunity (Chapter 17)
First line of defense	Second line of defense	Third line of defense
 Intact skin Mucous membranes and their secretions Normal microbiota 	 Natural killer cells and phagocytic white blood cells Inflammation Fever Antimicrobial substances 	 Specialized lymphocytes: T cells and B cells Antibodies

Figure 16.4 (2 of 3)

First line of defense- skin

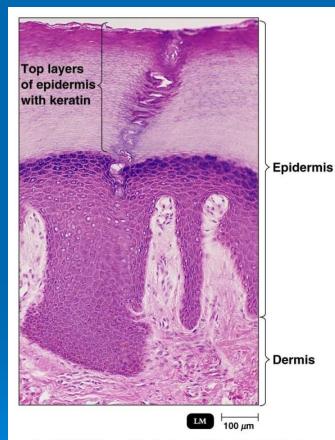

-Physical factors

- * Dermis and epidermis
- * Lots of keratin
- * Dry conditions, low temperature

First line of defense- skin

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

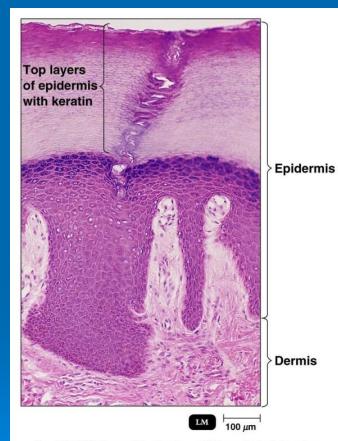

-Physical factors

- * Dermis and epidermis
- * Lots of keratin
- * Dry conditions, low temperature

-Chemical factors

- * Sebum (includes fungistatic and bacteriostatic fatty acids)
- * Low pH
- * High salt
- * Lysozymes (sweat)
- * IgA (sweat)

First line of defense- skin

-Physical factors

- * Dermis and epidermis

-**Physical factors** * Tears

-Chemical factors

* Lysozyme
* β Defensin
* IgA

Second line of defense: **Formed Elements in Blood**

TABLE 16.1 Formed Elements in Blood

4.8-5.4 million per μl or mm³ Function: Transport of O2 and CO2

II. Leukocytes (White Blood Cells)

5000-10,000 per µl or mm³

A. Granulocytes (stained)

1. Neutrophils (PMNs) (60-70% of leukocytes) Function: Phagocytosis

2. Basophils (0.5-1%) Function: Production of histamine

3. Eosinophils (2-4%) Functions: Production of toxic proteins against certain parasites; some phagocytosis

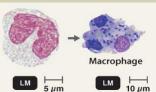

B. Agranulocytes (stained) 1. Monocytes (3-8%) Function: Phagocytosis (when they mature into macrophages)

2. Dendritic cells Functions: Derived from monocytes; phagocytosis and initiation of adaptive immune responses

3. Lymphocytes (20-25%) Natural killer (NK) cells Function: Destroy target cells by cytolysis and apoptosis

 T cells Function: Cell-mediated immunity (discussed in Chapter 17)

• B cells Function: Descendants of B cells (plasma cells) produce antibodies

⊢⊢⊢ 10 µm

⊢⊢ 2.5 μm LM

SEM of formed elements

Bruce Wetzel (photographer). Harry Schaefer (photographer) National Cancer Institute

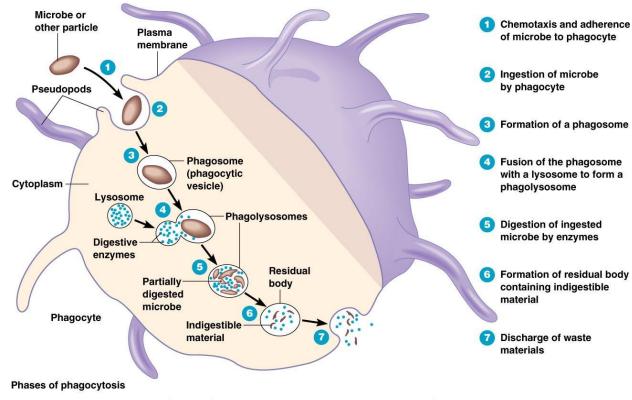

Complete blood count (CBC)

Type of cell	<u>Increase</u>	<u>Decrease</u>	
RBC	Erythrocytosis Polycythemia	Anemia	
WBCs	Leukocytosis	Leukopenia	Blood
- lymphocytes	Lymphocytosis	Lymphocytopenia	Anticoagulant in tube
- granulocytes	Granylocytosis	Granulocytopenia	Centrifuge
- neutrophils	Neutrophilia	Neutropenia	Plasma
- eosinophils	Eosinophilia	Eosinopenia	Cells
Platelets	Thrombocytosis	Thrombocytopenia	(a) Centrifuge blood to separate cells from plasma.
ALL cell lines		Pancytopenia	Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

Self-study for Thursday

- Preview the following processes:
 - Phagocytosis
 - Fever
 - Inflammation
 - Complement proteins

Second line of defense: Phagocytosis

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

Hacrophage Bacterium

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

Figure 16.7 - Overview

Figure 16.6

Microbial evasion of phagocytosis

 Inhibit adherence: M protein, capsules 	Streptococcus pyogenes, S. pneumoniae
 Kill phagocytes: Leukocidins 	Staphylococcus aureus
 Lyse phagocytes: Membrane attack complex 	Listeria monocytogenes
 Escape phagosome 	Shigella
 Prevent phagosome-lysosome fusion 	HIV
 Survive in phagolysosome 	Coxiella burnetti and Mycobacteria spp

Second line of defense: Fever

-Usually set at 37° C

-Some chemical signals set it higher -Cytokine interleukin-1 -Cytokine alpha-tumor necrosis factor -Prostoglandins reset hypothalamic thermostat

Second line of defense: Inflammation

Chemicals released

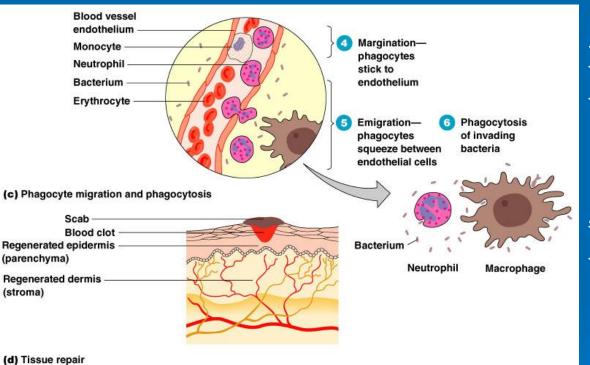

- 1. Histamine
- 2. Kinins
- 3. Prostaglandins
- 4. Leukotrienes
- 2. Vasodilation
 - Increased permeability
- 4. Activation of acute phase proteins

(5. Clot formation, abscess, tissue repair)

Inflammationchemical signals

Histamine	Vasodilation, increased permeability of blood vessels	
• Kinins	Vasodilation, increased permeability of blood vessels	
 Prostaglandins 	Intensity histamine and kinin effect	
• Leukotrienes	Increased permeability of blood vessels, phagocytic attachment	

Inflammation

MORE DETAIL:

Vasodilation/ increased Permeability

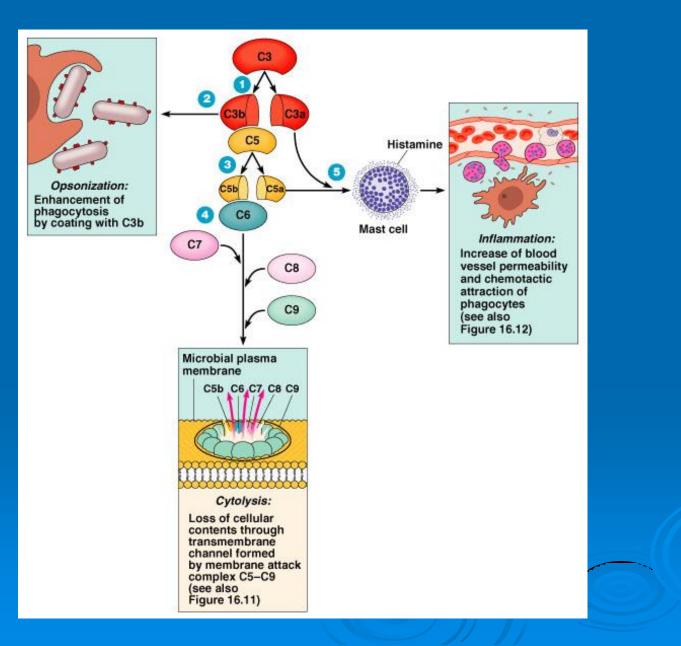

- Margination WBCs
- Emigration WBCs

Activation of acutephase proteins

- Cytokines
- Kinins
- Complement proteins
- (Interferons)

Complement system

Independent Study

- Review the following processes:
 - Phagocytosis
 - Fever
 - Inflammation
 - Complement proteins
